$$\begin{pmatrix}

#### A Basic Definitions

#### Notation Used

• Truth value

 $\vec{x}$ 

• Measured value

 $\tilde{\vec{x}}$ 

• Estimated or computed value

 $\hat{\vec{x}}$ 

Error

$$\delta \vec{x} = \vec{x} - \hat{\vec{x}}$$

### **B** Linearization

#### Linearization using Taylor Series Expansion

Given a non-linear system  $\dot{\vec{x}} = f(\vec{x}, t)$ 

Let's assume we have an estimate of  $\vec{x}$ , i.e.,  $\hat{\vec{x}}$  such that  $\vec{x} = \hat{\vec{x}} + \delta \vec{x}$ 

$$\dot{\vec{x}} = \dot{\vec{x}} + \delta \dot{\vec{x}} = f(\hat{\vec{x}} + \delta \vec{x}, t) \tag{11}$$

Using Taylor series expansion

$$f(\hat{\vec{x}} + \delta \vec{x}, t) = \dot{\hat{\vec{x}}} + \delta \dot{\vec{x}} = f(\hat{\vec{x}}, t) + \frac{\partial f(\vec{x}, t)}{\partial \vec{x}} \Big|_{\vec{x} = \hat{\vec{x}}} \delta \vec{x} + H.O.T$$

$$\approx \dot{\hat{\vec{x}}} + \frac{\partial f(\vec{x}, t)}{\partial \vec{x}} \Big|_{\vec{x} = \hat{\vec{x}}} \delta \vec{x}$$

$$\Rightarrow \delta \dot{\vec{x}} \approx \frac{\partial f(\vec{x}, t)}{\partial \vec{x}} \Big|_{\vec{x} = \hat{\vec{x}}} \delta \vec{x}$$
(12)

#### C Inertial Measurements

#### Actual Measurements

Initially the accelerometer and gyroscope measurements,  $\tilde{f}^b_{ib}$  and  $\tilde{\omega}^b_{ib}$ , respectively, will be modeled as

$$\tilde{\vec{f}}_{ib}^b = \vec{f}_{ib}^b + \Delta \vec{f}_{ib}^b \tag{13}$$

$$\tilde{\vec{\omega}}_{ib}^b = \vec{\omega}_{ib}^b + \Delta \vec{\omega}_{ib}^b \tag{14}$$

where  $\vec{f}_{ib}^b$  and  $\vec{\omega}_{ib}^b$  are the specific force and angular rates, respectively; and  $\Delta \vec{f}_{ib}^b$  and  $\Delta \vec{\omega}_{ib}^b$  represents the errors. In later lectures we will discuss more detailed description of these errors.

#### Error Modeling Example

Accelerometers

$$\tilde{f}_{ib}^{b} = \vec{b}_a + (\mathcal{I} + M_a)\vec{f}_{ib}^{b} + \vec{n}l_a + \vec{w}_a$$
 (15)

Gyroscopes

$$\tilde{\vec{\omega}}_{ib}^b = \vec{b}_g + (\mathcal{I} + M_g)\vec{\omega}_{ib}^b + G_g \vec{f}_{ib}^b + \vec{w}_g \tag{16}$$

Pos, Vel, Force and Angular Rate Errors

• Position error

$$\delta \vec{r}_{\beta b}^{\gamma} = \vec{r}_{\beta b}^{\gamma} - \hat{\vec{r}}_{\beta b}^{\gamma} \tag{17}$$

.11

.12

.13

.14

• Velocity error

$$\delta \vec{v}_{\beta b}^{\gamma} = \vec{v}_{\beta b}^{\gamma} - \hat{\vec{v}}_{\beta b}^{\gamma} \tag{18}$$

• Specific force errors

$$\delta \vec{f}_{ib}^b = \vec{f}_{ib}^b - \hat{f}_{ib}^b \tag{19}$$

$$\Delta_e \vec{f}_{ib}^b = \Delta \vec{f}_{ib}^b - \Delta \hat{f}_{ib}^b = -\delta \vec{f}_{ib}^b \tag{20}$$

• Angular rate errors

$$\delta \vec{\omega}_{ih}^b = \vec{\omega}_{ih}^b - \hat{\vec{\omega}}_{ih}^b \tag{21}$$

$$\Delta_e \vec{\omega}_{ib}^b = \Delta \vec{\omega}_{ib}^b - \Delta \hat{\vec{\omega}}_{ib}^b = -\delta \vec{\omega}_{ib}^b \tag{22}$$

D Attitude Error

#### Attitude Error Definition

Define

$$\delta C_b^{\gamma} = C_b^{\gamma} \hat{C}_{\gamma}^b = e^{[\delta \vec{\psi}_{\gamma b}^{\gamma} \times]} \approx \mathcal{I} + [\delta \vec{\psi}_{\gamma b}^{\gamma} \times]$$
 (23)

This is the error in attitude resulting from errors in estimating the angular rates.

Attitude Error Properties

The attitude error is a multiplicative small angle transformation from the actual frame to the computed frame

$$\hat{C}_b^{\gamma} = (\mathcal{I} - [\delta \vec{\psi}_{\gamma b}^{\gamma} \times]) C_b^{\gamma} \tag{24}$$

Similarly,

$$C_b^{\gamma} = (\mathcal{I} + [\delta \vec{\psi}_{\gamma b}^{\gamma} \times]) \hat{C}_b^{\gamma} \tag{25}$$

## Estimates of Sensor Measurements

#### Specific Force and Agnular Rates

Similarly we can attempt to estimate the specific force and angular rate by applying correction based on our estimate of the error.

$$\hat{\bar{f}}_{ib}^b = \tilde{\bar{f}}_{ib}^b - \Delta \hat{\bar{f}}_{ib}^b \tag{26}$$

$$\hat{\vec{\omega}}_{ib}^b = \tilde{\vec{\omega}}_{ib}^b - \Delta \hat{\vec{\omega}}_{ib}^b \tag{27}$$

where  $\hat{f}^b_{ib}$  and  $\hat{\omega}^b_{ib}$  are the accelerometer and gyroscope estimated calibration values, respectively.
